

A decorative graphic on the left side of the slide, consisting of a network of white lines and circles on a dark blue background, resembling a circuit board or a neural network.

SERVICE-PRÄSENTATION

TEAM 1, SERVICE 7 (PERSONS)

AGENDA

- Service
- Product Backlog
- ER-Modell
 - Person
 - Person Controller
 - Validierung des Builders
- Lessons Learned
- Weiteres Vorgehen

TEAMMITGLIEDER

- Jonas Liehmann (DevLead)
- Tobias Kärst (PO)
- Niklas Schumann
- Justin Noske

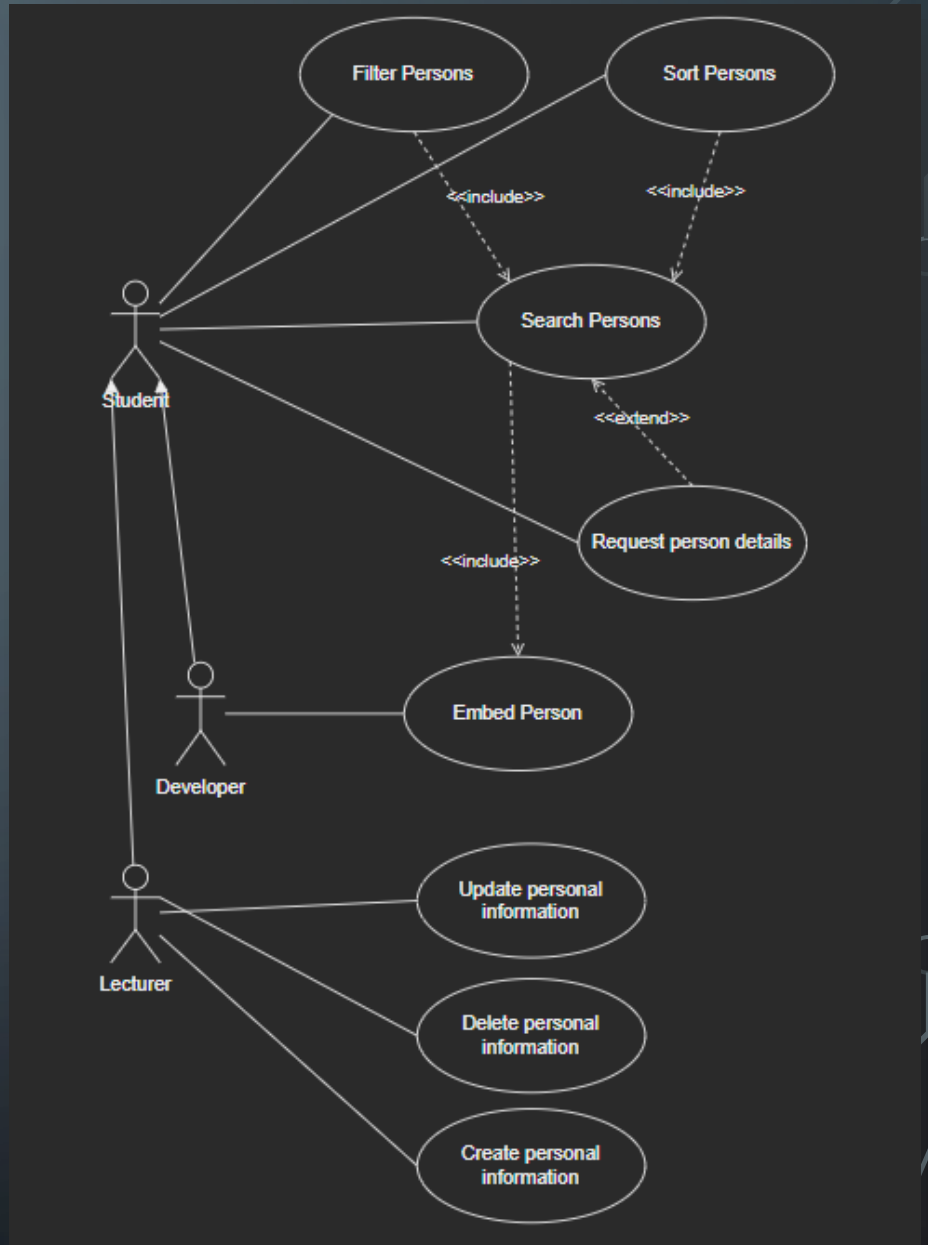

SERVICE

- Beinhaltet alle Informationen und Funktionen zur Kontaktaufnahme mit den Lehrenden an der FHE
- Ermöglicht eine intuitive Suche nach Personen nach bestimmten Suchkriterien
- Bietet eine Übersicht über die für Studierende relevanten Personen

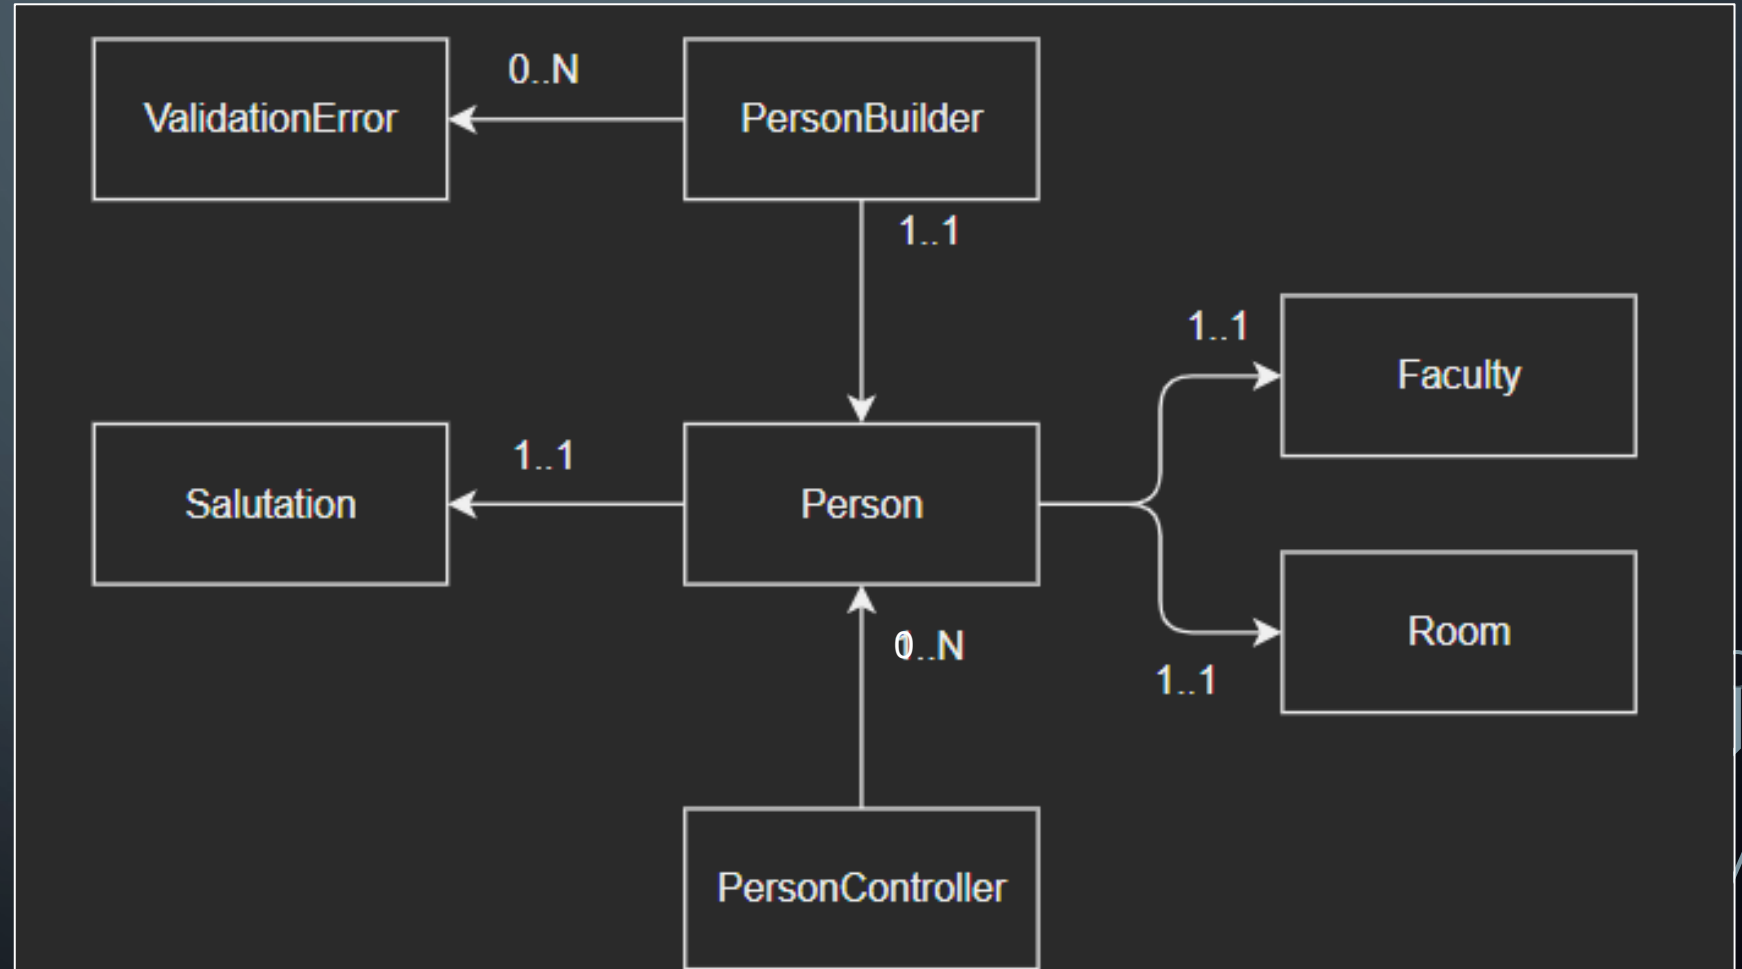

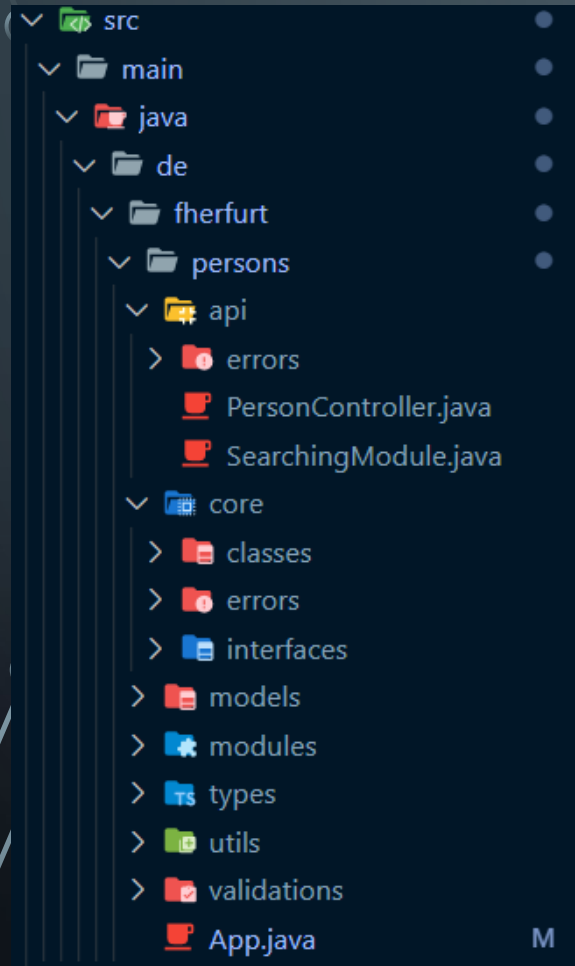

PRODUCT BACKLOG

- Lehrende sollen in der Lage sein, ihre Daten im System zu erstellen
- Lehrende sollen in der Lage sein, ihre Daten zu verändern
- Lehrende sollen in der Lage sein, ihre Daten zu löschen
- Studierende sollen in der Lage sein, Lehrende nach Namen zu suchen
- Die Namenssuche, soll keinen direkten Stringvergleich durchführen, sondern nach Namen suchen, die der Eingabe ähnlich sehen
- Studierende sollen in der Lage sein, die Lehrenden nach der Fakultät filtern zu können
- Studierende können die Personenliste nach folgenden Kriterien sortieren: Vorname, Nachname, Name, Position, Fakultät
- Für die Studierenden soll ein Suchverlauf erstellt werden

VALIDIERUNG DES BUILDERS

```
classDiagram
    class CheckedBuilder_B_T["CheckedBuilder<B, T>"] {
        - List<IValidator> validatorList
        - List<ValidationError> errorList
        + addValidator(IValidator): B
        + build(): Optional<T>
        + getErrors(): List<ValidationError>
        # checkAndGet(T): Optional
        - gotError(Optional): boolean
    }
    class IValidator["<<Interface>> IValidator"] {
        + validate(T): List<ValidationError>
    }
    class ValidationError {
        - msg: String
        - code: Integer
        + ValidationError(String, int)
        + toString(): String
    }
    class ValidationCondition_T["ValidationCondition<T>"] {
        - code: Integer
        - msg: String
        - error: boolean
        - value: T
        + withCode(int): ValidationCondition
        + withValue(T): ValidationCondition
        + withMsg(String): ValidationCondition
        + checkCondition(boolean): ValidationCondition
        + isRequired(String): ValidationCondition
        + isBetween(int, int, String): ValidationCondition
        + isMin(int, String): ValidationCondition
        + evaluate(): Optional<ValidationError>
    }
    class ValidationCondition_T_Validator["PersonValidator"] {
        + validate(T): List<Validation
    }
    class ValidationCondition_T_Regex["RegexChecker"] {
        + checkPhone(String): boolean
        + checkFax(String): boolean
        + checkEmail(String): boolean
    }
    class ValidationErrorBuilder_T["ValidationErrorBuilder<T>"] {
        - errors: List<ValidationError>
        + withCondition(ValidationCondition): ValidationErrorBuilder
        + addTo(List<ValidationError>): ValidationErrorBuilder
        + evaluate(List<ValidationError>): List<ValidationError>
    }
    CheckedBuilder_B_T --|> IValidator : Extends
    CheckedBuilder_B_T --> ValidationError
    CheckedBuilder_B_T --> ValidationCondition_T
    CheckedBuilder_B_T --> ValidationErrorBuilder_T
    IValidator ..> PersonValidator : validate(T)
    IValidator ..> RegexChecker : validate(T)
```

The diagram illustrates the Builder pattern for validation. It includes the following classes and interfaces:

- CheckedBuilder<B, T>**: A class that implements the **IValidator** interface. It maintains a list of validators and a list of errors. It provides methods to add validators, build the object, and retrieve errors. It also has a `checkAndGet` method and a `gotError` property.
- IValidator**: An interface that defines the `validate` method, which returns a list of **ValidationError** objects.
- ValidationError**: A class representing a validation error, with attributes for message and code, and methods for creation and string representation.
- ValidationCondition<T>**: A class representing a validation condition, with attributes for code, message, error status, and value. It provides methods to create conditions with various parameters and to evaluate them against a value.
- PersonValidator**: A concrete implementation of the **IValidator** interface, which uses the **ValidationCondition** class to validate person objects.
- RegexChecker**: A concrete implementation of the **IValidator** interface, which uses the **ValidationCondition** class to validate strings against regular expressions.
- ValidationErrorBuilder<T>**: A class that builds **ValidationError** objects based on **ValidationCondition** objects. It maintains a list of errors and provides methods to add conditions, add errors, and evaluate the list.

```
String json = ""{
    "firstname": "Max",
    "lastname": "Mustermann",
    "faculty": 3,
}
"";

Optional<Person> person = builder
    .addValidator(new PersonFilledValidator())
    .fromJSON(json)
    .build();

if (person.isPresent()) {
    System.out.println(person.get());
}
```

```
new ValidationBuilder<String>()
    .withCondition(new ValidationCondition<String>()
        .withValue(person.getFirstname())
        .isRequired("firstname"))
    .withCondition(new ValidationCondition<String>()
        .withValue(person.getFirstname())
        .isBetween(2, 30, "firstname"))
    .addTo(errors);
```

```
Optional<Person> person = builder
    .addValidator(new PersonFilledValidator())
    .withName("Max", "Mustermann")
    .build();

if (person.isPresent()) {
    System.out.println(person.get());
}
```

```
Optional<Person> person = builder
    .addValidator(new PersonFilledValidator())
    .fromPerson(oldPerson)
    .withName("Paul", "Mustermann")
    .build();
}
```

LESSONS LEARNED

- Abkapselung in Module besonders für Teamaufteilung und Tests sinnvoll
- Durch Abstraktion der API kann man sich voll auf die Logik konzentrieren, sodass am Ende eine viel saubere Architektur entsteht

WEITERES VORGEHEN

- Restliche Unit-Tests fertig implementieren
- Damit verbundene Fehlersuche
- Projektdokumentation fertig schreiben

The image features a dark blue gradient background. In the corners, there are decorative white line art elements resembling circuit boards or neural networks, with lines and small circles connecting them.
